

ABSTRACTLUG FOR FIXING A WINDOW REGULATOR, WINDOW REGULATOR  
AND VEHICLE BODY

5

A vehicle window regulator has a fixing lug (14) comprising a first part (16) for fixing to a rail having a window-guiding direction, and a second part (18) for fixing to a vehicle body, the second part being in a plane having a normal (N) that is inclined in relation to the guiding direction. The normal to the second part is preferably inclined at an angle of approximately 45° in relation to the window-guiding direction. The advantage is that the lug can be fixed in the body without the lug turning on itself during fixing by screwing for example.
